

AI-NATIVE WEB LANGUAGE THAT CUTS GENERATED SOURCE BY 90%+

# Kethic

Build more with fewer generated tokens.

Nigeria | Pre-seed | Raising \$50k

## WHY NOW

# AI builders are becoming the new way software is made

- Every generated page still comes out as verbose HTML, CSS, JavaScript, React, or Tailwind.
- Output tokens are the expensive part of AI code generation.
- As AI builders scale, code verbosity becomes a direct cost problem.

## PROBLEM

# AI website builders waste tokens on code users never asked to see

- A simple landing page can require thousands of generated tokens.
- Long generated code increases cost, latency, and repair loops.
- Emerging-market builders are hit harder because compute cost matters more.

## SOLUTION

# Kethic lets AI write compact intent, then compiles it into real web code

- AI writes compact Kethic source.
- The compiler outputs accessible HTML, responsive CSS, and runtime JavaScript.
- Quality moves from prompt luck into compiler rules.

# The prototype is already working

- Compiler pipeline: lexer, parser, type checker, code generator, runtime.
- Web layer: pages, components, navigation, forms, responsive layouts, state, events, interactions.
- Build, tests, and web quality validation pass locally.

## BENCHMARK

# Kethic generated the same website with 96%+ less source

- Same website task. Same model. Kethic compiled successfully.
- React/Tailwind baseline: 5,224 completion tokens and 21,449 source characters.
- Kethic macro output: 198 completion tokens and 782 source characters.

**96.21%**

lower output tokens

**96.35%**

smaller source

**91.60%**

lower total tokens

## WHAT MAKES IT DIFFERENT

# Kethic is a language layer, not another website builder UI

- AI generates less source code.
- The compiler expands compact patterns into production web output.
- The same language can be used by ChatGPT, Claude, Gemini, Cursor, and hosted builders.

# AI software generation needs a cheaper source layer

- AI builder platforms.
- No-code and low-code tools.
- Solo founders, SMEs, and developer tooling teams.
- Global South builders where AI compute cost is a bigger barrier.

## COMPETITION

# Current tools generate verbose platform code; Kethic compresses the source layer

- Lovable/Bolt-style builders: strong UX, verbose generated code underneath.
- React/Tailwind/HTML: powerful but token-heavy.
- Token DSL experiments: compact, but not focused on production-quality full websites.
- Kethic combines compression, compiler validation, and real web output.

## Start open source; monetize the hosted builder

- Release the compiler, AI guide, benchmarks, examples, and public demos.
- Show side-by-side token savings against React, Tailwind, and HTML.
- Grow through AI builder communities, developer tool users, and Global South founders.
- Hosted Kethic builder becomes the paid product after language adoption.

## FUNDING

# We are raising \$50k pre-seed

- Finish the language core.
- Build fetch/data and backend primitives.
- Publish public docs and benchmark demos.
- Launch the hosted Kethic builder.
- Onboard early users and contributors.

BUILD MORE WITH FEWER GENERATED TOKENS.
